

**Amendments to the Claims:**

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A semiconductor device comprising:

a bus master;

a bus interface that controls access to at least one semiconductor storage medium based on request for access to the at least one semiconductor storage medium from the bus master, the at least one semiconductor storage medium including a plurality of semiconductor storage media, the bus interface including a plurality of dedicated bus interfaces that each correspond to one of the plurality of semiconductor storage media; and

a clock-supply-control circuit that controls the presence of the supply of a clock signal to the bus interface based on access state information that indicates a state of access to the at least one semiconductor storage medium, the clock-supply-control circuit including a circuit, the circuit implementing at least one of control for stopping the supply of the clock signal to the bus interface if the circuit determines that access is not in execution, and control for supplying the clock to the bus interface if the circuit determines that access is in execution, based on the access state information;

~~the~~ a first dedicated bus interface-block of the plurality of dedicated bus interfaces stopping to receive a clock signal a first predetermined time elapsed after an access of the first dedicated bus interface-block to ~~the~~ a first storage medium-media is completed,

~~the~~ a second dedicated bus interface-block of the plurality of dedicated bus interfaces stopping to receive a clock signal a second predetermined time elapsed after an access of the second dedicated bus interface-block to ~~the~~ a first-second storage medium-media is completed.

2. (Currently Amended) The semiconductor device according to Claim 1, the bus interface further including a common bus interface that in common implements operation required for access control when access to any of the plurality of semiconductor storage media is in execution;

the plurality of dedicated bus interfaces each correspond to a certain one of the plurality of semiconductor storage media and that each implement operation required for access control only when access to the certain one of the plurality of semiconductor storage media is in execution; and

the clock-supply-control circuit detects any of the plurality of semiconductor storage media that is other than any of the plurality of semiconductor storage media that is to be accessed based on accessed-medium information indicating which semiconductor storage ~~medium-media~~ is to be accessed, and controls so as to stop the supply of the clock signal to any of the plurality of dedicated bus interfaces for the any of the plurality of semiconductor storage media that is other than the any of the plurality of semiconductor storage media that is to be accessed and supply the clock signal to any of the plurality of dedicated bus interfaces for the any of the plurality of semiconductor storage media that is to be accessed.

3. (Currently Amended) The semiconductor device according to Claim 1, the clock-supply-control circuit implementing a process to stop the supply of the clock signal to the bus interface after the completion of a valid signal output from the bus interface.

4. (Currently Amended) A semiconductor circuit that controls a presence of a supply of a clock signal to a bus interface controlling access to at least one semiconductor storage medium based on request for access to the at least one semiconductor storage medium from a bus master, comprising:

a control-signal generator that generates a clock-supply-control signal for the bus interface for instructing the presence of the supply of the clock signal to the given bus interface, based on access state information that indicates a state of access to the at least one semiconductor storage medium; and

a control circuit that controls the presence of the supply of the clock signal generated from a clock signal generator to the given bus interface, based on the clock-supply-control signal for bus interface,

the control-signal generator disabling the clock-supply-control signal for bus interface if the access state information indicates that access is not in execution;

the control circuit including a circuit that controls so as to stop the supply of the clock signal generated from the clock signal generator to the bus interface if the clock-supply-control signal for the bus interface is disabled;

the at least one semiconductor storage medium including a plurality of semiconductor storage media; and

the bus interface including a plurality of dedicated bus interfaces that each correspond to one of the semiconductor storage media;

~~the~~ a first dedicated bus interface-block of the plurality of dedicated bus interfaces stopping to receive a clock signal a first predetermined time elapsed after an access of the first dedicated bus interface-block to ~~the~~ a first storage medium-media is completed,

~~the~~ a second dedicated bus interface-block of the plurality of dedicated bus interfaces stopping to receive a clock signal a second predetermined time elapsed after an access of the second dedicated bus interface-block to ~~the~~ a first-second storage medium-media is completed.

5. (Currently Amended) The semiconductor circuit according to Claim 4,  
the bus interface further including

a common bus interface that in common implements operation required  
for access control when access to any of the semiconductor storage media is in execution;

the dedicated bus interfaces each implement operation required for  
access control only when access to the certain one of the semiconductor storage media is in  
execution;

the control-signal generator detects any of the semiconductor storage media  
that is other than any of the semiconductor storage media that is to be accessed based on  
accessed-medium information shown by the bus interface and indicating which  
semiconductor storage ~~medium~~ media is to be accessed, so as to disable a clock-supply-  
control signal for dedicated bus interface to any of the plurality of dedicated bus interfaces for  
the any of the semiconductor storage media that is other than the any of the semiconductor  
storage media that is to be accessed; and

the control circuit includes a circuit that controls so as to stop the supply of the  
clock signal generated from the clock signal generator to the any of the dedicated bus  
interfaces for the any of the semiconductor storage media that is other than the any of the  
semiconductor storage media that is to be accessed if the clock-supply-control signal for the  
dedicated bus interface is disabled.

6. (Currently Amended) The semiconductor circuit according to Claim 4, the  
control-signal generator disabling the clock-supply-control signal for the dedicated bus  
interface after the completion of a valid signal from the bus interface.

7. (Original) Electronic equipment, comprising:  
a semiconductor device that includes the semiconductor device according to  
Claim 1;

an input device that receives input information; and  
an output device that outputs a result processed by an information-processing device based on the input information.

8. (Original) Electronic equipment, comprising:  
a semiconductor device that includes the semiconductor circuit according to Claim 4;  
an input device that receives input information; and  
an output device that outputs a result processed by an information-processing device based on the input information.

9. (Currently Amended) A method of controlling a clock-supply that controls a  
~~the presence of a supply of a clock~~ signal to a bus interface of a semiconductor device,  
comprising:  
generating a clock-supply-control signal for the bus interface for instructing  
~~the presence of the supply of the clock~~ signal to a given bus interface, based on access state  
information that indicates a state of access to at least one semiconductor storage medium; and  
controlling ~~the presence of the supply of the clock~~ signal generated from a  
clock-signal ~~clock~~ generator to the given bus interface, based on the clock-supply-control  
signal for the bus interface,  
the clock-supply-control signal for the bus interface being disabled if the  
access state information indicates that access is not in execution;  
control to stop the supply of the clock generated from the clock generator to  
the bus interface ~~block~~ being implemented if the clock-supply-control signal for the bus  
interface is disabled,  
the at least one semiconductor storage medium including a plurality of  
semiconductor storage media, and

the bus interface including a plurality of dedicated bus interfaces that each correspond to one of the plurality of semiconductor storage media;

~~the a first dedicated bus interface-block of the plurality of dedicated bus interfaces~~ stopping to receive a clock signal a first predetermined time elapsed after an access of the first dedicated bus interface-block to ~~the a first storage medium-media~~ is completed,

~~the a second dedicated bus interface-block of the plurality of dedicated bus interfaces~~ stopping to receive a clock signal a second predetermined time elapsed after an access of the second dedicated bus interface-block to ~~the a first-second storage medium-media~~ is completed.

10. (Currently Amended) The method of controlling a clock-supply according to Claim 9, the bus interface further including:

a common bus interface that in common implements operation required for access control when access to any of the semiconductor storage media is in execution;

~~the-dedicated bus interfaces~~ that each implement operation required for access control only when access to a certain one of the semiconductor storage media is in execution;

any of the semiconductor storage media that is other than any of the semiconductor storage media that is to be accessed is detected, based on accessed-medium information shown by the bus interface, and indicating which semiconductor storage ~~medium media~~ media is to be accessed, and a clock-supply-control signal for the dedicated bus interface to any of the dedicated bus interfaces for the any of the semiconductor storage media that is other than the any of the semiconductor storage media that is to be accessed is disabled; and

control is implemented so that the supply of the clock signal generated from the ~~clock-signal-block~~ generator to the any of the dedicated bus interfaces for the any of the semiconductor storage media that is other than the any of the semiconductor storage media

that is to be accessed is stopped if the clock-supply-control signal for the dedicated bus interface is disabled.

11. (Currently Amended) The method of controlling a clock-supply according to Claim 9, the clock-supply-control signal for the dedicated bus interface being disabled after the completion of a valid signal from the bus interface.

12. (Previously Presented) The semiconductor device according to Claim 1,  
the bus interface outputting a BUSY signal to the clock-supply-control circuit,  
the BUSY signal indicating the access of the bus interface being in execution,  
and

the clock-supply-control circuit implementing a control for stopping the supply of the clock to the bus interface at least one clock cycle elapsed after the access completion indicated by the BUSY signal.

13. (Currently Amended) A semiconductor device, comprising:  
a bus master; and  
a bus interface that includes a plurality of dedicated bus ~~interface~~interfaces  
~~blocks~~, each of the plurality of dedicated bus ~~interface~~interfaces~~blocks~~ accesses one storage  
~~medium~~media of a plurality of storage media,

the semiconductor device being configured such that:

a first dedicated bus interface ~~block~~ of the plurality of dedicated bus  
~~interface~~interfaces~~blocks~~ receives a clock signal during at least a part of a first period in  
which the first dedicated bus interface ~~block~~ accesses a first storage ~~medium~~media of the  
plurality of storage media,

the first dedicated bus interface ~~block~~ does not receive a clock signal  
during at least a part of a second period in which the first dedicated bus interface ~~block~~ does  
not access the first storage ~~medium~~media,

a second dedicated bus interface ~~block~~ of the plurality of ~~first dedicated~~  
bus ~~interface blocks~~interfaces receives a clock signal during at least a part of a third period in  
which the second dedicated bus interface ~~block~~ accesses a second storage ~~medium~~media of  
the plurality of storage media; and

the second dedicated bus interface ~~block~~ does not receive a clock signal  
during at least a part of a fourth period in which the second dedicated bus interface ~~block~~ does  
not access the second storage ~~medium~~media.

14. (Canceled)

15. (Previously Presented) The semiconductor device according to Claim 3, a  
length of the predetermined time being longer than one clock cycle.

16. (New) The semiconductor device of claim 1, wherein the at least one  
semiconductor storage medium is externally located to the bus interface.
